

General Catalog: Products and Solutions

www.heidenhain.com

DR. JOHANNES HEIDENHAIN GmbH develops and manufactures linear and angle encoders, rotary encoders, evaluation units and numerical controls. HEIDENHAIN supplies its products to manufacturers of machine tools as well as automated machines and systems, especially in the semiconductor and electronics manufacturing industries.

HEIDENHAIN is represented in over 50 countries—mainly through its own subsidiaries. Sales engineers and service technicians assist users on-site with technical information and servicing.

Fundamentals and processes

The high quality of HEIDENHAIN products depends on special production facilities and measuring equipment. Masters and submasters for scale manufacturing are produced in a clean room with special measures for temperature stabilization and vibration insulation. HEIDENHAIN develops and builds most of the machines it needs for the production and measurement of linear and circular scales, including the necessary copying equipment.

30 m long measuring machine for scale tapes

Vacuum machine for application of chromium layers

Competence in the area of linear and angular metrology is reflected by a large number of customized solutions for users. Among other implementations, they include the measuring and test equipment developed and built for standards laboratories and the angle encoders for telescopes and satellite receiving antennas. Of course, the products in the standard HEIDENHAIN product program profit from the knowledge gained.

Precision graduations: the foundation for high accuracy

The heart of a HEIDENHAIN encoder is its measuring standard, usually in the form of a grating with typical line widths of 0.25 μm to 10 μm . These precision graduations are manufactured in a process invented by HEIDENHAIN (e.g. DIADUR or METALLUR) and are a decisive factor in the function and accuracy of encoders. The graduations consist of lines and gaps at defined intervals with very little deviation, forming structures with very high edge definition. These graduations are resistant to mechanical and chemical influences and can tolerate vibration and shock. All measuring standards have a defined thermal behavior.

Phase grating with approx. 0.25 μm grating height

DIADUR

DIADUR precision graduations are composed of an extremely thin layer of chromium on a substrate—usually of glass or glass ceramic. The accuracy of the graduation structure lies within the micron and submicron range.

METALLUR

With its special optical composition of reflective gold layers, METALLUR graduations show a virtually planar structure. They are therefore particularly tolerant to contamination.

Phase gratings

Special manufacturing processes make it possible to produce three-dimensional graduation structures, possessing defined optical characteristics. The structure widths are in the range of a few microns down to quarters of a micron.

SUPRADUR

Graduations manufactured with the SUPRADUR process function optically like three-dimensional phase gratings, but they have a planar structure and are therefore particularly insensitive to contamination.

OPTODUR

The OPTODUR process produces graduation structures with particularly high reflectance. Its composition as an optically three-dimensional, planar structure is similar to the SUPRADUR graduation.

MAGNODUR

Thin magnetically active layers in the micron range are structured for very fine, magnetized graduations.

DIADUR and METALLUR graduations on various carrier materials

Sealed linear encoders

Sealed linear encoders from HEIDENHAIN are protected from dust, chips and splash fluids and are ideal for operation on machine tools.

- Accuracy grades as fine as $\pm 2\text{ }\mu\text{m}$
- Measuring steps of down to $0.001\text{ }\mu\text{m}$
- Measuring lengths of up to 72 m
- Fast and simple installation
- Large mounting tolerances
- High acceleration loading
- Protection against contamination

- Sealed linear encoders are available with
- **Full-size scale housing**
 - For high vibration loading
 - Up to 72 m measuring length
 - **Slimline scale housing**
 - For limited installation space
 - Measuring lengths of up to 2040 mm (for measuring lengths starting from 1240 mm, mounting via mounting spar or tensioning elements)

The aluminum housing of a HEIDENHAIN sealed linear encoder protects the scale, scanning carriage and its guideway from chips, dust and fluids. Downward-oriented elastic lips seal the housing. The scanning carriage travels along the scale on a low-friction guide. It is connected to the external mounting block by a coupling that compensates unavoidable misalignment between the scale and the machine guideways.

Exposed linear encoders

Exposed linear encoders from HEIDENHAIN operate with no mechanical contact between the scanning head and the scale or scale tape. Typical areas of application for these encoders include **measuring machines, comparators** and other **precision devices, as well as production and measuring equipment**, for example in the semiconductor industry.

- Accuracy grades of $\pm 0.5\text{ }\mu\text{m}$ and better
- For measuring steps of down to $0.001\text{ }\mu\text{m}$ (1 nm)
- Measuring lengths of up to 30 m
- No friction between scanning head and scale
- Small dimensions and low mass
- High traversing speeds

Length gauges

Length gauges from HEIDENHAIN feature integral guideways for the plunger. They are used to monitor measuring equipment, in industrial metrology, and as position encoders.

- Accuracy grades as fine as $\pm 0.1\text{ }\mu\text{m}$
- For measuring steps of down to $0.005\text{ }\mu\text{m}$ (5 nm)
- Measuring lengths of up to 100 mm
- High measuring accuracy
- Available with automated plunger drive
- Simple mounting

With **incremental linear encoders**, the current position is determined by starting at a reference point and counting measuring steps, or by subdividing and counting signal periods. Incremental encoders from HEIDENHAIN feature reference marks, which must be scanned after switch-on to reestablish the reference point. This process is especially simple and fast with distance-coded reference marks.

Absolute linear encoders from HEIDENHAIN require no previous traverse to provide the current position value. The encoder transmits the absolute value through the **EnDat interface** or another serial interface.

The recommended **measuring steps** listed in the table refer primarily to position measurements. Smaller measuring steps, which are attained through higher interpolation factors of sinusoidal output signals, are useful in particular for applications in rotational speed control, e.g. on direct drives.

Under the designation **functional safety**, HEIDENHAIN offers encoders with purely serial data transmission as single-encoder systems for safety-related machines and systems. The two measured values are already formed independently of each other in the encoder, and are transmitted to the safe control via the EnDat interface.

LC, LF, LS, LB sealed linear encoders

With full-size scale housing

Linear encoders with **full-size scale housing** are characterized particularly by high tolerance to vibration.

Absolute linear encoders of the **LC 100** and **LC 200** series provide the **absolute position value** without requiring any previous traverse. Depending on the version, incremental signals can be output additionally. The LC 100 can be mounted to the same mating dimensions as the incremental linear encoders of the **LS 100** series and features the same mechanical design. Because of their high accuracy and defined thermal behavior, LC 100 and LS 100 series linear encoders are especially well suited for use on **numerically controlled machine tools**.

The incremental encoders of the **LF** type feature measuring standards with relatively fine grating periods. This makes them particularly attractive for applications requiring very **high repeatability**.

The **LS 600** series incremental linear encoders are used for simple positioning tasks, for example on **manual machine tools**.

The **LC 200** (absolute) and **LB** (incremental) linear encoders were designed for very **long measuring lengths**. Their measuring standard—a steel tape with METALLUR graduation—is delivered as a single piece, and after the housing sections have been mounted, is pulled through the sections, drawn to a defined tension and fixed at both ends to the machine base.

Absolute position measurement

LC 100 series

- Absolute position measurement
- Defined thermal behavior
- High vibration resistance
- Two mounting attitudes
- Single-field scanning

LC 200 series

- Absolute position measurement
- For long measuring lengths of up to 28 m⁴⁾
- Defined thermal behavior
- High vibration resistance
- Two mounting attitudes
- Single-field scanning

Incremental position measurement

LS 100 series

- Incremental position measurement
- Defined thermal behavior
- High vibration resistance
- Two mounting attitudes
- Single-field scanning

LF 185

- Incremental position measurement
- Very high repeatability
- Thermal behavior similar to steel or cast iron
- High vibration resistance
- Two mounting attitudes
- Single-field scanning

LB 383

- Incremental position measurement
- For large measuring lengths of up to 72 m
- Defined thermal behavior
- High vibration resistance
- Two mounting attitudes
- Single-field scanning

LS 600 series

- Incremental position measurement
- Typically for manual machines
- Simple mounting

LC, LF, LS sealed linear encoders

With slimline scale housing

Sealed linear encoders with **slimline scale housing** are primarily used where installation space is limited.

Absolute linear encoders of the **LC 400** series provide the **absolute position value** without requiring any previous traverse. Like the **LS 400** series incremental linear encoders, their high accuracy and defined thermal behavior make them especially well suited for use on **numerically controlled machine tools**.

The incremental encoders of the **LF** type feature measuring standards with relatively fine grating periods. This makes them particularly attractive for applications requiring very **high repeatability**.

The **LS 300** series incremental linear encoders are used for simple positioning tasks, for example on **manual machine tools**.

Simple installation with mounting spar

The use of a mounting spar is of great benefit when mounting slimline linear encoders. It can be fastened as part of the machine assembly process. The encoder is then simply clamped on during final mounting. Easy exchange also facilitates servicing. Moreover, installation with a mounting spar significantly improves the encoder's acceleration behavior.

LIP, LIF exposed linear encoders

For very high accuracy

The exposed linear encoders of the **LIP** and **LIF** design are characterized by small measuring steps together with high accuracy. The measuring standard is a phase grating applied to a substrate of glass or glass ceramic.

- LIP** and **LIF** encoders are typically used for:
- Measuring machines and comparators
 - Measuring microscopes
 - Ultra-precision machines such as diamond lathes for optical components, facing lathes for magnetic storage disks, and grinding machines for ferrite components
 - Measuring and production equipment in the semiconductor industry
 - Measuring and production equipment in the electronics industry

For special **high-vacuum applications**, suitable encoders are the LIF 481V and LIF 471V (for high-vacuum applications down to 10⁻⁷ bar) and the LIF 481 U (for ultrahigh vacuum applications down to 10⁻¹¹ bar).

- LIP 200 series**
- Very high repeatability with compact dimensions
 - Measuring lengths of up to 3040 mm
 - Measuring steps of down to < 1 nm
 - Defined thermal behavior thanks to a measuring standard on Zerodur glass ceramic scale

- LIP 6000 series**
- For highly dynamic applications
 - For limited installation space
 - Measuring steps of down to 1 nm
 - Position detection through limit switches and homing track

- LIF 400 series**
- Fast, simple scale fastening with PRECIMET adhesive film
 - Insensitive to contamination thanks to SUPRADUR graduation
 - Position detection through limit switches and homing track

PP exposed linear encoders

Two-coordinate encoders

The **PP** two-coordinate encoders feature as measuring standard a planar phase-grating structure on a glass substrate. This makes it possible to measure positions in a plane.

- Applications include:
- Measuring and production equipment in the semiconductor industry
 - Measuring and production equipment in the electronics industry
 - Extremely fast X-Y tables
 - Measuring machines and comparators
 - Measuring microscopes

	<i>Incremental</i> PP 281
Measuring standard	DIADUR phase grating on glass

Measuring range	68 mm x 68 mm, other measuring ranges upon request
Reference mark	One per coordinate

LIC, LIDA exposed linear encoders

For high accuracy and long measuring lengths

The **LIC** and **LIDA** exposed linear encoders are designed for **high traversing speeds** of up to 10 m/s and **large measuring lengths** of up to 30 m.

The **LIC** encoders make **absolute position measurement** possible over measuring lengths of up to 28 m. In their dimensions, they correspond to LIDA 400 and LIDA 200 incremental linear encoders.

The LIC 4113V and LIC 4193V encoders are suitable for special **high-vacuum applications** (down to 10⁻⁷ bar).

On the **LIC** and **LIDA** linear encoders, steel scale tapes typically serve as substrate for METALLUR graduations. With the LIC 41x3 and LIDA 4x3, graduation carriers of glass or glass ceramics permit **thermal adaptation** thanks to their different coefficients of linear expansion.

LIC and LIDA exposed linear encoders are typically used for:

- Coordinate measuring machines
- Inspection machines
- PCB assembly machines
- PCB drilling machines
- Precision handling devices
- Position and velocity measurement on linear motors

There are **various possibilities for easy mounting** of the LIC and LIDA encoders:

LIC 41x3, LIDA 4x3

- Scale of glass or glass ceramic is bonded directly onto the mounting surface

LIC 41x5, LIDA 4x5

- One-piece steel scale tape pulled through aluminum extrusions and tensioned at its ends
- The aluminum extrusions can be screwed or bonded onto the mounting surface

LIC 41x7, LIC 31x7, LIC 21x7, LIDA 4x7, LIDA 2x7

- One-piece steel scale-tape pulled through aluminum extrusions and fastened at center
- The aluminum extrusions are bonded onto the mounting surface

LIC 41x9, LIC 31x9, LIC 21x9, LIDA 4x9, LIDA 2x9

- One-piece steel scale tape is bonded directly to the mounting surface
- Also available with functional safety (LIC 4119)

Absolute position measurement

LIC 4100 series

- Very high accuracy and long measuring lengths
- Various mounting options
- Grating on steel scale tape, glass or glass ceramic
- Also available with functional safety

LIC 3100 series

- High accuracy and long measuring lengths
- Various mounting options
- Scale tape cut from roll

LIC 2100 series

- Large mounting tolerance
- For simple applications

Incremental position measurement

LIDA 400 series

- Long measuring lengths of up to 30 m
- Various mounting options
- Limit switches

LIDA 200 series

- Scale tape cut from roll
- Large mounting tolerance
- For simple applications
- Simple installation through integrated function display

⁴⁾ Only for Robax glass ceramic up to ML 1640 mm

⁵⁾ Only with encoders with 1 V_{PP} or EnDat 2.2 interface

⁶⁾ ±5 µm after linear length-error compensation in the downstream electronics

AT, CT, MT, ST length gauges

For measuring stations and multipoint inspection apparatuses

HEIDENHAIN length gauges are characterized by high accuracy together with large strokes of up to 100 mm. They feature plungers with integral bearings and therefore serve as compact measuring devices.

The **HEIDENHAIN-CERTO** CT length gauges are used predominantly for production quality control of high-precision parts and for the monitoring and calibration of reference standards.

The **HEIDENHAIN-METRO** MT 1200 and MT 2500 length gauges are ideal for precision measuring stations and testing equipment. The ball-bush guided plunger tolerates high radial forces. The primary applications for the MT 60 and MT 101 are incoming inspection, production monitoring and quality control. They are also used as high-accuracy position encoders, for example on linear slides or X-Y tables.

Thanks to their very small dimensions, the **HEIDENHAIN-ACANTO** AT and **HEIDENHAIN-SPECTO** ST series length gauges are the product of choice for multipoint inspection apparatus and testing equipment.

Plunger actuation
The plungers of the length gauges with **motorized** plunger actuation are extended and retracted by an integral motor. They are operated through the associated switch box.

Length gauges with plunger actuation by **coupling** have no plunger drive. The freely movable plunger is connected by a separate coupling with the moving machine element.

The length gauges with plunger actuation **by the measured object** or **with cable-type lifter** feature a spring-loaded plunger that is extended in its resting position.

The MT 1281 and ST 1288 length gauges are available with various gauging forces. Particularly for fragile materials this makes it possible to measure without deformation.

On the length gauges with **pneumatic** plunger actuation, the plunger is retracted by the integral spring at its rest position. It is extended to the measuring position by application of compressed air.

HEIDENHAIN-ACANTO

- Online diagnostics
- Protection up to IP67
- Absolute scanning

HEIDENHAIN-CERTO

- For highest accuracy
- Low thermal expansion through thermally invariant materials
- High-precision ball bearing guide

HEIDENHAIN-METRO
MT 1200 and MT 2500

- High repeatability
- Various gauging force variants
- Various possibilities for plunger actuation

HEIDENHAIN-METRO
MT 60 and MT 101

- Large measuring ranges
- Plunger actuation by motor or coupling
- Ball-bush guided plunger

HEIDENHAIN-SPECTO

- Exceptionally compact dimensions
- Protection up to IP67
- Especially durable ball-bush guide
- Variant for harsh ambient conditions

Angle encoders

HEIDENHAIN angle encoders are characterized by high accuracy values in the range of angular seconds and better. These devices are used in applications such as rotary tables and swivel heads of machine tools, indexing heads, high-precision angle measuring tables, precision devices in angular metrology, antennas and telescopes.

- Line counts: typically 9000 to 180 000
- Accuracy: from $\pm 5''$ to $\pm 0.4''$
- Measuring steps as fine as 0.000 01° or 0.036'' (incremental) or 29 bits, i.e. approx. 536 million positions per revolution (absolute)

Rotary encoders

Rotary encoders from HEIDENHAIN serve as measuring sensors for rotary motion, angular velocity, and when used in conjunction with mechanical measuring standards such as lead screws, for linear motion. Application areas include electrical motors, machine tools, printing machines, wood-working machines, textile machines, robots, elevators and handling devices, as well as various types of measuring, testing and inspection devices.

- Line counts of typically 50 to 5000
- Accuracy grades: to $\pm 10''$ (depending on the line count, corresponding to $\pm 1/20$ of the grating period)
- Measuring steps: as fine as 0.000 01°. Particularly for photoelectric rotary encoders, the high quality of the sinusoidal incremental signals permits high interpolation factors for digital speed control.

Absolute angle encoders and rotary encoders require no previous traverse to provide the current position value. **Singleturn encoders** provide the current angular position value within one revolution, while **multiturn encoders** can additionally distinguish between revolutions. The position values are output, for example, over the purely serial, bidirectional **EnDat** interface. It enables automatic configuration of the higher-level electronics and provides monitoring and diagnostic functions.

Under the designation **functional safety**, HEIDENHAIN offers encoders with purely serial data transmission as single-encoder systems for safety-related machines and systems. The two measured values are already formed independently of each other in the encoder, and are transmitted to the safe control via the data interface.

With **incremental angle encoders and rotary encoders**, the current position is determined by starting at a reference point and counting measuring steps, or by subdividing and counting signal periods. Incremental encoders from HEIDENHAIN feature reference marks to reestablish the reference point.

Incremental rotary encoders with commutation signals provide the angular shaft position value—without requiring previous traverse—with sufficient accuracy to correctly control the phases of the rotating field of a permanent-magnet three-phase motor.

Mounting variants

In angle encoders and rotary encoders with integral bearing and **stator coupling**, the graduated disk of the encoder is connected directly to the shaft to be measured. The scanning unit is guided on the shaft via ball bearings, supported by the stator coupling. As a result, during angular acceleration of the shaft, the stator coupling must absorb only that torque resulting from friction in the bearing. These angle encoders therefore provide excellent dynamic performance. Thanks to the stator coupling, the system accuracy includes the error of the shaft coupling. Other benefits of the stator coupling are:

- Simple mounting
- Short overall length
- High natural frequency of the coupling
- Hollow through shaft is possible

Angle encoders and rotary encoders with integral bearings for a **separate shaft coupling** are designed with a solid shaft. The recommended coupling to the measured shaft compensates radial and axial tolerances. Angle encoders for separate shaft couplings permit higher shaft speeds.

Angle encoders and rotary encoders **without integral bearing** operate without friction. The two components—the scanning head and the scale disk, drum or tape—are adjusted to each other during assembly. The benefits are:

- Little space required
- Large hollow-shaft diameters
- High shaft speeds possible
- No additional starting torque

RCN, RON, RPN sealed angle encoders

With integral bearing and integrated stator coupling

Because of their high static and dynamic accuracy, the **RCN, RON** and **RPN** angle encoders with integral bearings and integral stator couplings are the preferred encoders for high-precision applications such as rotary tables and tilting axes. The measuring standard is usually a circular scale with DIADUR graduation. For the encoders with stator coupling, the specified accuracy includes the error resulting from mounting. For angle encoders with separate shaft coupling, the coupling error must be added to find the system accuracy.

- Features of the **RCN 2001, RCN 5001** and **RCN 8001** series angle encoders:
- **High system accuracies** that account for position error within one revolution and within one signal period, as well as errors arising from the coupling, while maintaining wide mounting tolerances
 - **Optimized scanning technology**, so that even liquid contamination or condensation droplets barely affect the scanning signal quality and therefore the motor control
 - **Simple acquisition of temperature values of direct drive motors** through evaluation of the winding temperatures in the direct drive motors using an EIB 5000
 - **High permissible speeds** with purely serial interface: up to 3000 rpm
 - Possibility of mechanical fault exclusion against loosening of the encoder-to-drive connection

- RCN 2001, RCN 200 and RON 200 series**
- Compact dimensions
 - Sturdy design
 - Typically used with rotary tables, tilting tables, for positioning and speed control

- RCN 5001 series**
- Large hollow shaft and small installation space
 - Stator mounting dimensions compatible with RCN 2001

- RCN 8001, RON 700 and RON/RPN 800 series**
- Large hollow shaft diameters of up to Ø 100 mm
 - System accuracies: ±2" and ±1"
 - Typically used on rotary and angle measuring tables, indexing heads, measuring setups, image scanners, etc.

RCN 8001
D = 60 mm or 100 mm

ROC, ROD sealed angle encoders

With integral bearing

ROC and ROD angle encoders with solid shaft for separate shaft coupling are particularly suited to applications where higher shaft speeds and larger mounting tolerances are required. The precision shaft couplings allow up to ±1 mm of axial motion.

ROC and ROD angle encoders feature a DIADUR circular scale as measuring standard. For angle encoders with separate shaft coupling, the angular measuring error caused by the shaft coupling must be added to find the system accuracy.

For separate shaft coupling: ROC 2000 and ROD 200

- Compact dimensions
- Sturdy design
- Typically used with rotary tables, tilting tables, for positioning and synchronization monitoring

For separate shaft coupling: ROC 7000, ROD 780 and ROD 880

- High accuracy
ROC 7000, ROD 780: ±2"
ROD 880: ±1"
- Ideal for angle measurement on high-precision rotary tables, indexing heads or measuring machines

MRP, SRP angle encoder modules

Assemblies for high-precision rotary axes

MRP angle encoder module: combination of angle encoder and bearing

Angle encoder modules from HEIDENHAIN are optimally matched combinations of angle encoders and high-precision bearings. They boast high measuring and bearing accuracy, very high resolution, exceptional repeatability, and excellent smoothness due to a low starting torque. Their design as specified and tested complete assemblies makes handling and installation easier.

Mounting option 1

Mounting option 2

SRP angle encoder module: combination of angle encoder, bearing and motor

SRP angle encoder modules are additionally equipped with an integrated torque motor. They combine a motor, precision bearing and encoder with very high accuracy in one compact system. The torque motor with its very low cogging torque enables extraordinarily smooth motion control. Neither disruptive cogging torques nor radial forces impair the high guideway accuracy of the bearing.

MRP 2000 series

Angle encoder modules with integrated encoder and bearing

- Particularly compact dimensions
- High measuring and bearing accuracy
- Hollow shaft diameter: 10 mm

MRP 5000 series

Angle encoder modules with integrated encoder and bearing

- Compact dimensions
- High measuring and bearing accuracy
- Hollow shaft diameter: 35 mm

ERP, ERO modular angle encoders

Without integral bearing, with optical scanning

The HEIDENHAIN **ERP** and **ERO** angle encoders without integral bearing operate without friction and use a circular glass scale with hub as the graduation carrier. They are characterized by their low weight and compact dimensions. They thus permit high accuracies and are designed for integration in machine elements or components.

The attainable system accuracy depends on the eccentricity of the graduation to the drive shaft bearing, as well as the radial runout and wobble of the bearing.

The interferential scanning principle serves as the basis for the high accuracy of the **ERP** encoders. This makes them particularly attractive for high-precision angle measuring tables and precision devices in angular metrology. Additionally, the HSP 1.0 signal stabilization feature makes the encoders highly resistant to environmental factors.

Applications for the **ERO** are found in metrology, in compact rotary tables, and in precise, highly dynamic drives.

- ERP 1000 series**
- Very high resolution and accuracy
 - Small mass, low mass moment of inertia
 - Very flat design
 - Circular scale available as full circle or segment

- ERO 2000 series**
- Very compact dimensions
 - Small mass, low mass moment of inertia
 - For highly dynamic applications

ECA, ERA modular angle encoders

Without integral bearing, with optical scanning

The **ECA** and **ERA** HEIDENHAIN angle encoders with solid graduation carrier function without integral bearings. They are intended for integration in machine elements or components.

The attainable system accuracy depends on the eccentricity of the graduation to the drive shaft bearing, as well as the radial runout and wobble of the bearing.

The **ECA** and **ERA** angle encoders feature a sturdy steel scale drum and are suited for high shaft speeds of up to 20000 rpm. They are typically found on fast running spindles, rotary tables and tilting axes.

The ECA 4000 V angle encoders are suitable for vacuum applications in high vacuum (down to 10⁻⁷ bar).

ECA 4400 series

- High accuracy
- Sturdy design with steel scale drum and METALLUR graduation
- Various drum versions
 - ECA 4xx0*: with centering collar
 - ECA 4xx2*: with 3-point centering

ERA 4000 series

- High shaft speeds of up to 20000 rpm
- Sturdy design with steel scale drum and METALLUR graduation
- Axial motion of measured shaft permissible up to ± 0.5 mm
- The ERA 4480C is available with larger diameters or as versions with protective cover
- Various drum versions
 - ERA 4xx0*: with centering collar
 - ERA 4xx2*: with 3-point centering

ECM, ERM modular angle encoders

Without integral bearing, with magnetic scanning

The **ECM and ERM** modular angle encoders from HEIDENHAIN with magnetic scanning consist of a magnetized scale drum and a scanning unit. Their MAGNODUR measuring standard and the magnetoresistive scanning principle make them particularly tolerant to contamination.

The attainable system accuracy depends on the eccentricity of the graduation to the drive shaft bearing, as well as the radial runout and wobble of the bearing.

Typical fields of application include machines and equipment with **large hollow shaft diameters** in environments with large amounts of airborne particles and liquids, for example:

- Rotary and tilting axes for ERM 2280 and ECM 2400
- C axes on lathes for ERM 2410, ERM 2420 and ERM 2480
- Main spindles on milling machines for ERM 2484, ERM 2485 and ERM 2984

Absolute position measurement

ECM 2400 series

- Drum fastening with screws
- Functional safety with ECM 2410

Incremental position measurement

ERM 2200 series

- High graduation accuracy
- Distance-coded reference marks
- Drum fastening with screws
- **ERM 2283**: small interpolation error, no reversal error

ERM 2400 series

- Distance-coded reference marks
- Drum fastening with screws
- Large selection of drum diameters

ERM 2484 and ERM 2984 series

- Especially compact dimensions for limited installation space
- High mechanically permissible shaft speeds and therefore particularly well suited for spindles
- Drum fastening by axial clamping

ECN, EQN, ERN rotary encoders

With integral bearing and mounted stator coupling
Up to IP66 protection

HEIDENHAIN **ECN**, **EQN** and **ERN** rotary encoders with integral bearing and stator-mounted coupling operate by photoelectric scanning. They are characterized by their simple mounting and short overall length. Possible applications range from simple measuring tasks to position and speed control on servo drives. The hollow shaft of these encoders is slid directly onto and fastened to the shaft to be measured. During angular acceleration of the shaft, the stator coupling must absorb only that torque resulting from friction in the bearing. Rotary encoders with stator coupling therefore provide excellent dynamic performance and a high natural frequency.

- ECN/EQN/ERN 1000 series**
- Miniaturized version
 - Blind hollow shaft with 6 mm inside diameter
 - Housing outside diameter: 35 mm
 - Typical natural frequency f_N of the encoder coupling: 1500 Hz
 - Mech. permissible speed: ≤ 12000 rpm

ECN/EQN/ERN 1000
ECN/EQN/ERN 400

ECN/ERN 100

- ECN/EQN/ERN 400 series**
- Compact dimensions
 - Blind hollow shaft or hollow through shaft with 8 mm, 10 mm or 12 mm inside diameter
 - Housing outside diameter: 58 mm
 - Protection:
IP67 at housing (IP66 with hollow through shaft)
IP64 at shaft inlet (IP66 upon request)
 - Typical natural frequency f_N of the encoder coupling: 1550 Hz (cable version)
 - Mech. permissible speed: ≤ 12000 rpm
 - Fault exclusion of the mechanical coupling for functional safety available

- ECN/ERN 100 series**
- For large shaft diameters
 - Hollow through shaft with inside diameters D: 20, 25, 38, 50 mm
 - Housing outside diameter: 87 mm
 - Typical natural frequency f_N of the encoder coupling: 1000 Hz
 - Mechanically permissible speed:
D ≤ 30 mm: ≤ 6000 rpm
D > 30 mm: ≤ 4000 rpm

ECN, EQN, ERN rotary encoders

With integral bearing and mounted stator coupling
Up to IP40 protection

The **ECN, EQN** and **ERN** photoelectric rotary encoders from HEIDENHAIN with IP40 protection are specially designed for integration in motors. Bearings and mounted stator coupling are integrated. Absolute rotary encoders and versions with commutation tracks are available for synchronous motors. The taper shaft or the blind hollow shaft is fastened directly to the shaft to be measured. This ensures an extremely stiff coupling that permits exceptionally high dynamic performance of the drive. The stator coupling is designed to be fastened on a plane surface or a location hole and permits fast, simple mounting.

ECN/EQN 1100

ERN 1123

ECN/EQN/ERN 1300

ECN/EQN 1100 series

ROC, ROQ, ROD rotary encoders

With integral bearing, for separate shaft coupling

HR handwheel

The **ROC, ROQ** and **ROD** photoelectric rotary encoders from HEIDENHAIN have integrated bearings and are sealed. The degree of protection is IP64 to IP66, depending on the version. They are robust and compact.

These encoders are coupled by the rotor to the measured shaft through a separate coupling that compensates axial motion and misalignment between the encoder shaft and measured shaft.

The **HR** electronic handwheel features an integral bearing and mechanical detent. It was designed for use in portable or stationary housings, e.g. for positioning units or automation applications.

- ROC/ROQ/ROD 1000 series**
- Miniaturized dimensions for installation in small devices or in limited installation space
 - Mounting by synchro flange
 - Shaft diameter: 4 mm

- HR handwheel**
- Compact dimensions
 - Sturdy design
 - Mechanical detent

- ROC/ROQ/ROD 400 series**

ECI, EQI, EBI rotary encoders

Without integral bearing

Compared with optical rotary encoders without integral bearings, inductive rotary encoders are particularly robust and have large mounting tolerances.

The **ECI, EQI and EBI 1100** inductive rotary encoders as well as the **ECI, EQI and EBI 1300** are mechanically compatible with the corresponding ExN photoelectric encoders: the shaft is fastened with a central screw. The stator of the encoder is fastened by several screws.

The correct installation of the rotary encoders without integral bearing can be inspected with the HEIDENHAIN PWM 21 or PWT 101 measuring and testing devices.

ECI/EQI/EBI 1100

ECI/EQI 1100 with tolerance sleeve

ERO, ECI, EBI rotary encoders

Without integral bearing

The photoelectric **ERO** modular rotary encoders from HEIDENHAIN consist of a graduated disk with hub and a scanning unit. They are particularly well suited for **limited installation space** or for applications where there must be **no friction**.

The **ECI/EBI 100** and **ECI/EBI 4000** inductive rotary encoders have a particularly small outside diameter with a large shaft opening. The encoders were conceived for simple axial mounting.

The correct installation of the rotary encoders without integral bearing can be inspected with the HEIDENHAIN PWM 21 or PWT 101 measuring and testing devices.

KCI, KBI rotary encoders

Without integral bearing

With its KCI 100/KBI 100 and KCI 1300/KBI 1300 series, HEIDENHAIN provides inductive encoders for compact robot motors. The circular scales can be screw-fastened or press-fit onto a motor shaft.

The KCI/KBI inductive rotary encoders are designed for direct installation. Consisting solely of a scale and scanning unit, they do not have a housing. This enclosure-less design saves considerable space and enables easy integration into the application. The KCI/KBI rotary encoders are also available as dual encoders in *Dplus* versions, with front and back scanning for two separate circular scales. As a result, these encoders provide position feedback both upstream and downstream from the gearbox with a single encoder.

The KCI 100/KBI 100 *Dplus* dual encoders from HEIDENHAIN provide position feedback both upstream and downstream from the gearbox. By providing position feedback downstream from the gearbox, these dual encoders can compensate for inaccuracies inherent in the design of dynamic and highly articulated robots.

Controls for milling machines

With its TNC controls, HEIDENHAIN offers a complete product line for all common types of machines in the area of milling: from a simple three-axis CNC milling machine to a highly complex machine with up to 23 axes—a TNC control is always the right choice. Thanks to their flexible operational design and practical functions, the TNCs are particularly suitable for the following applications:

- Simple milling, drilling and boring operations
- Machining in a tilted working plane
- Complex 5-axis operations
- High-speed cutting operations
- Milling-turning operations
- Jig grinding
- Gear hobbing or skiving

TNC controls are versatile and offer the right programming function for any task. Thanks to its **HEIDENHAIN Klartext** format, the user need not learn G codes or special programming languages. Instead, the control guides the user with conversational questions and tips. Ease of use is also promoted by clear, **unambiguous key symbols** and names. Each key has only one function. Even if you are used to **G-code programming**, however, the TNC is still the right control—you can simply enter the G codes.

TNC part programs have long lives because they are **upwardly compatible**. Programs from older TNCs can usually also run on the new models. When moving up to a more advanced TNC, the user merely builds on what he already knows.

Controls for lathes

Lathe controls from HEIDENHAIN have been proving themselves for years both on standard and complex lathes as well as on turning centers. Many shop-compatible functions support you optimally during:

- Conventional lathe operations
- Machining with driven tools
- Machining with the C and Y axes
- Full-surface machining with dual spindles
- Machining with the B axis

HEIDENHAIN lathe controls are extremely flexible: whether you need only single cycles, short program sequences or complete NC programs—you only need to select the appropriate operating mode.

Program creation with **smart.Turn** is particularly easy and convenient. The straightforward fillable-form input provides graphical support, meaningful dialogs, and a logical check of entries.

You can also reuse NC programs of older HEIDENHAIN lathe controls, such as the CNC PILOT 4290, on the CNC PILOT 640. With a convenient import filter you can simply load the programs into the new control, and then continue using them on the CNC PILOT 640.

Quickly and easily to the finished part

The operational design of the milling and lathe controls is tailored to the needs of the user and therefore offers you the greatest possible flexibility in program creation. When **programming at the machine**, all required inputs are guided by practice-oriented prompts and questions while highly expressive help images support you. For standard operations and even complex applications, users can draw on a wide variety of **cycles** for machining, coordinate transformations and machine setup.

HEIDENHAIN controls can be **programmed remotely** equally well on a CAD/CAM system as on a HEIDENHAIN programming station.

Directly on the control, users can open **DXF, STEP** or **IGES** files created on a separate CAD system. They can then extract contours and machining positions as needed. This not only saves time otherwise spent on programming and testing, but you can also be sure that the adopted data is exactly in accordance with the design engineer's specifications.

User-friendly and practical

Thanks to the robust design optimized for the application, HEIDENHAIN controls are ideally suited for a harsh work-day environment. The intuitive screen displays tips, dialog boxes, program steps, graphical aids and tiles. All texts are available in numerous languages. The 3D illustrations representing the machine, fixtures, tools and workpiece simplify programming and provide valuable aid for verifying the program.

High quality and productivity

Thanks to intelligent motion control, HEIDENHAIN controls enable short machining times with perfect workpiece surfaces and very high workpiece accuracy. The bottom line is an increase in productivity: unit costs are reduced without affecting accuracy and surface quality.

Automating manual operations

With controls from HEIDENHAIN you can machine your workpieces one step at a time, without having to create an entire machining program. You can switch between manual and automatic positioning as often as desired.

Manufacturing complex components precisely

Regardless of whether the workpieces are simple or complex—HEIDENHAIN controls offer the appropriate functions. With them, neither are operations in a tilted plane a challenge, nor is multi-side or full-surface machining. Simultaneous machining with up to five axes is an especially strong point of HEIDENHAIN controls. With special control strategies, functions for process monitoring, and compensation of production-induced disturbances, you can also manufacture components with complex geometries exactly, with process reliability, and efficiently.

TNC7 contouring control

For milling machines, milling-turning machines and machining centers

The **TNC7** supports you perfectly in your daily work and opens up completely new possibilities. Its optimized operating design ensures highly efficient and ergonomic operation at the machine tool. The control also provides optimal visualization of the workpiece and work envelope for easier programming, setup and machining.

The TNC7 is ideally suited for milling, turning, grinding and 5-axis machining on:

- Universal milling machines
- Boring mills
- High-speed machines
- Machining centers
- Large machines
- Milling-turning machines

Thanks to its optimized motion control, fast block processing and special control strategies, the TNC7 achieves impressive results. As a result, the TNC7 stands for exceptional contour accuracy at very high machining speeds.

The TNC7 supports you from the initial idea to the finished workpiece. Its graphical programming feature allows you to draw contours directly on the touchscreen and then automatically convert them into and save them in the Klartext conversational programming language. For aligning workpiece and fixtures, the TNC7 offers graphically supported probing functions (as a software option). And during machining, a process monitoring software option, that can be fully integrated into the machining process, ensures consistent part quality even during automated manufacturing.

TNC7 basic contouring control

For milling machines

The HEIDENHAIN **TNC7 basic** is a compact and versatile contouring control. Thanks to its optimized user experience and extensive functionality, it is especially well suited for use on universal milling and drilling machines for:

- Serial and single-part production
- Tool making
- Machine building
- Repair departments
- Training and education facilities

With up to eight control loop and an expanded range of options, the TNC7 basic is an ideal solution for simple milling machines, drilling machines and machining centers. The versatile options that can be used with the control include Optimized Contour Milling, collision monitoring and graphically supported setup for fixtures and workpieces. The TNC7 basic provides optimal user support every day on the shop floor.

TNC 640 contouring control

For milling machines, milling-turning machines and machining centers

Besides milling, the **TNC 640** from HEIDENHAIN is also capable of combined milling and turning operations. It is particularly well suited for milling, turning, high-speed machining and 5-axis machining. The shop-oriented and versatile control features numerous functions.

The TNC 640 is especially well suited for milling, turning, grinding and 5-axis machining on:

- Universal milling machines
- Boring mills
- High-speed machines
- Machining centers
- Large machines
- Milling-turning machines

The TNC 640 features **optimized motion control, short block processing times** and special closed-loop control strategies. Together with its **uniform digital design** and its integrated digital drive control including inverters, it enables you to reach very high machining speeds and the best possible contour accuracy—particularly when machining 3D contours.

You can program **turning contours** with the TNC 640 in the familiar HEIDENHAIN Klartext format. Beyond this, you have typical contour elements for turning (recesses, undercuts, thread undercuts) as well as cycles for complex turning operations.

TNC 620, TNC 320 contouring controls

For milling machines

The HEIDENHAIN **TNC 620** and **TNC 320** controls are compact but versatile contouring controls. Thanks to their flexible operation—shop-oriented programmability with the HEIDENHAIN Klartext format or offline programming—and their scope of features, they are especially suited for use on universal milling, drilling and boring machines for the following:

- Serial and single-part production
- Tool making
- Machine building
- Research and development
- Prototypes and pilot plants
- Repair departments
- Training and education facilities

Thanks to its **digital design**, the **TNC 620** has control over the machine's entire drive system. Not only does the field-proven digital drive technology from HEIDENHAIN make high contour fidelity and rapid machining at high speeds possible, but also all control components of the TNC 620 are connected via digital interfaces. The TNC 620 is available in a touch-screen version as well as in a screen and keyboard version.

Because of its analog outputs (which also provide nominal speed values), the **TNC 320** is well suited for retrofitting on machine tools.

TNC 128 straight-cut control

For milling machines

The **TNC 128** from HEIDENHAIN is a compact but versatile straight-cut control for three servo axes and servo spindle. A further servo axis is an option. Thanks to its user-friendly operation and scope of features, it is especially well suited for use on universal milling, drilling and boring machines for the following possibilities:

- Series and single-part production
- Machine building
- Prototypes and pilot plants
- Repair departments
- Training and education facilities

Because of its analog output that also provides nominal speed values, the TNC 128 is well suited for retrofitting on machine tools.

CNC PILOT 640 contouring control

For lathes and turning-milling machines

The **CNC PILOT 640** offers you the right support thanks to its flexible design and versatile programming capabilities — regardless of whether you are manufacturing single parts or batches, simple or complex workpieces. The CNC PILOT 640 is characterized by its simple operation and programming. It is quickly learned and requires minimum training time.

The CNC PILOT 640 was designed for CNC lathes and is ideal for both horizontal and vertical lathes as well as for vertical boring and turning mills.

The CNC PILOT 640 supports lathes with main and counter spindle, one slide (X and Z axis), C axis or positionable spindle, driven tools, and machines with Y and B axes.

Regardless of whether you are turning simple parts or complex workpieces, the CNC PILOT 640 provides you with the benefits of graphical contour input and convenient programming with smart.Turn. With the TURN PLUS software option, you can even create an NC program at the touch of a button. Once you've defined your contour, material and workholding, TURN PLUS automatically handles the rest.

The CNC PILOT 640 also supports multi-channel machining. Different machining steps can then be performed simultaneously using multiple slides.

	CNC PILOT 640
Axes	Up to 24 control loops; up to 8 NC axes per channel; up to 6 spindles in the overall system
Interpolation	<ul style="list-style-type: none">• Straight line: in 2 principal axes, optional in 3 principal axes• Circle: in 2 axes, optional additional linear interpolation in the third axis• C1/C2 axis¹⁾: interpolation of X and Z linear axes with the C1/C2 axis• B axis¹⁾: 5-axis interpolation between the X-, Z-, Y-, B- and C axis
Program entry	smart.Turn, DIN PLUS, Teach-In mode ¹⁾

MANUALplus 620 contouring control

For CNC and cycle lathes

The **MANUALplus 620** is a compact and versatile contouring control that is particularly well suited for cycle-controlled lathes. The MANUALplus 620 optimally combines the ease of use of conventional lathes with the advantages of CNC-controlled machines.

Regardless of whether you are manufacturing single parts or batches or whether your workpieces are simple or complex, the control adapts to the needs of your company. The MANUALplus 620 is characterized by its simple operation and programming. It is quickly learned and requires minimum training time.

The MANUALplus 620 supports lathes with main and counter spindle, one slide (X and Z axis), C axis or positionable spindle, and driven tools, as well as machines with Y and B axes.

	MANUALplus 620
Axes	Up to 10 control loops, of which up to 6 can be configured as spindles

Contouring controls

Digital control design

HEIDENHAIN control packages are perfectly matched systems specifically developed for use on machine tools with rigorous requirements. These packages usually consist of the following:

- Software
- Control hardware and real-time hardware
- Drive electronics
- Motors
- Encoders

In this uniformly digital control solution, all components are connected over purely digital interfaces: the control components over **HSCI** (HEIDENHAIN Serial Controller Interface), which is the HEIDENHAIN real-time protocol for Fast Ethernet, and the encoders over **EnDat 2.2**, the bidirectional interface from HEIDENHAIN. This achieves a high degree of availability for the entire system. It can be diagnosed and is immune to noise—from the main computer to the encoder. The outstanding characteristics of the uniform digital solution from HEIDENHAIN guarantee very high accuracy and surface quality, together with high traversing speeds.

Digital drive control

High surface quality, high contouring accuracy of the finished workpiece and short machining times—these requirements can be met only with digital control techniques. Here HEIDENHAIN offers NC products with integrated digital drive control.

The following HEIDENHAIN controls are available with HSCI and digital drive control:

- TNC7
- TNC7 basic
- TNC 640
- TNC 620
- CNC PILOT 640
- MANUALplus 620

Motors for axis and spindle drives

HEIDENHAIN offers various motors for axis and spindle drives as accessories to its controls with integrated inverters:

- Feed motors with a stall torque of 1.5 Nm to 120 Nm and a power rating ranging from 0.5 kW to 14.4 kW.
- Spindle motors with a power rating ranging from 5.5 kW to 43.2 kW.

Inverter systems

Either compact or modular inverters are available, depending on the type of machine.

Compact inverters contain the power electronics for up to five control loops and a controller unit for up to six motors with an overall system power rating of up to 30 kW. For the **modular inverters**, supply units from 30 kW to 135 kW as well as various power modules for axes and spindles are available. Modular inverters are suitable for machines with up to 24 control loops, of which up to four can be configured as spindles.

Gen 3 drives

With the new Gen 3 components, HEIDENHAIN offers a complete system that is based on highly innovative and future-oriented technologies. You profit from state-of-the-art interface technology, improved performance data and increased controller performance. This makes the Gen 3 drive technology a key component for machines that must fulfill stringent requirements regarding availability, surface quality and machining time.

Gen3

TNC 640
With modular inverters,
motors and position
encoders

Accessories

Electronic handwheels and programming stations

With an electronic handwheel from HEIDENHAIN, you can use the feed drive to make very precise movements in the axis slides in proportion to the rotation of the handwheel. As an option, the handwheels are available with mechanical detent.

HR 510, HR 520 and HR 550 FS portable handwheels

The axis keys and certain function keys are integrated in the housing. This way you can switch axes or set up the machine at any time—and regardless of where you happen to be standing. The **HR 520** also features a display for the position value, the feed rate, the spindle speed, the operating mode, and other functions, as well as override potentiometers for the feed rate and spindle speed. You can enjoy unlimited freedom of movement with the **HR 550 FS** with radio transmission. Its features correspond to those of the HR 520.

HR 550 FS HR 510

HR 130 and HR 180 panel-mounted handwheels

Panel-mounted handwheels from HEIDENHAIN can be integrated in the machine operating panel or be installed at another location on the machine. With the HRA 180 handwheel adapter, up to three HR 180 electronic panel-mounted handwheels can be connected.

HR 130 for integration into the machine operating panel

The TNC7, TNC7 basic, TNC 640 and TNC 620/TNC 320 programming stations allow you to create Klartext programs away from all the noise of the shopfloor, just as if you were working at the machine. With the DataPilot CP 640 and the DataPilot MP 620 you can also use smart.Turn, G codes and cycles to create programs for your HEIDENHAIN lathe controls.

Creating programs

The programming, testing and optimizing of HEIDENHAIN Klartext or G-code programs with the programming station substantially reduces machine idle time. You do not need to change your way of thinking. At the programming station you program on the same keyboard as at the machine.

Training with the programming station

Because the programming stations are based on the respective control software, they are ideally suited for apprentice and advanced training.

TNC training in schools

Since they can be programmed with G codes as well as in Klartext conversational format, the programming stations can also be used in schools for TNC programming training.

VT 121, VT 122 vision systems for tool inspection

The vision systems for tool inspection consist of two components:

- Camera with two objectives (VT 121, VT 122)
- Touch-operated PC software (VTC)

The VT 122 is available in two variants:

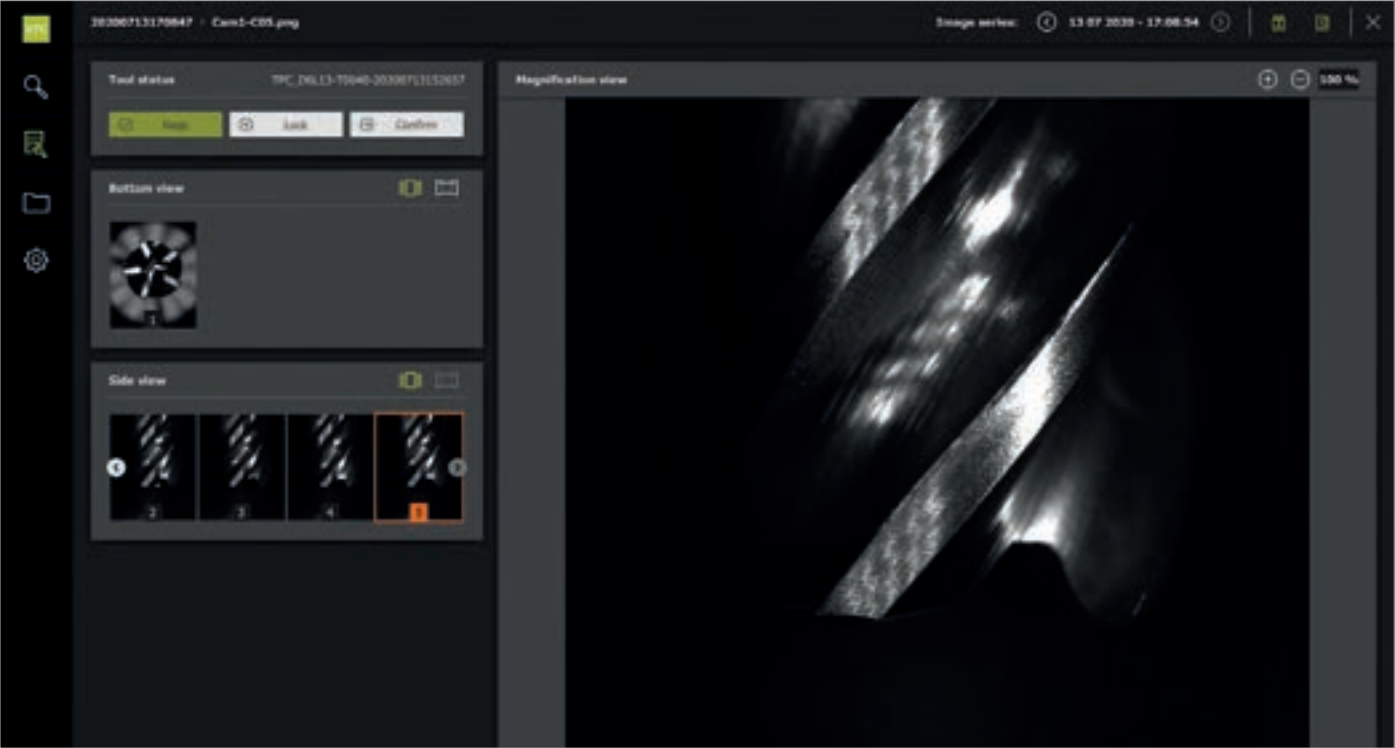

- With connections through the base plate for mounting on a prepared machine, or
- With lateral connections for variable cable routing

The vision systems enable tool imaging during machining. Besides documenting tool status and wear, the following applications are possible as well:

- Tool inspection before critical machining steps
- Optimization of cutting parameters
- Optimization of NC programs
- Breakage detection
- Tool inspection after expiration of tool life

Your benefits:

- Automated imaging during machining
- Time savings, since the tool stays in the machine
- Compact system, even usable with very large tools
- Rugged design
- Controlled compressed-air cleaning
- PC software for configuration and evaluation also on the TNC

The software solutions of the Digital Shop Floor from HEIDENHAIN are ideal for manufacturing companies that use CNC machine tools. They provide support along the process chain, ensuring improved process quality and enabling sustainable productivity gains.

Software solutions for your manufacturing operations

StateMonitor gives you insight into the production processes of your machine tools in real time. It collects and visualizes machine statuses, machine messages, NC program data and many other types of data related to the machine. StateMonitor provides greater insight into production processes, optimizes the use of machines and shortens user response times during malfunctions.

- Interfaces:
- HEIDENHAIN DNC
 - OPC UA
 - MTConnect
 - Modbus TCP
 - FOCAS

Machine data collection with StateMonitor

Software options for use with StateMonitor

JobTerminal enables the machine-based management of machining jobs and of their quantities and nominal/actual times.

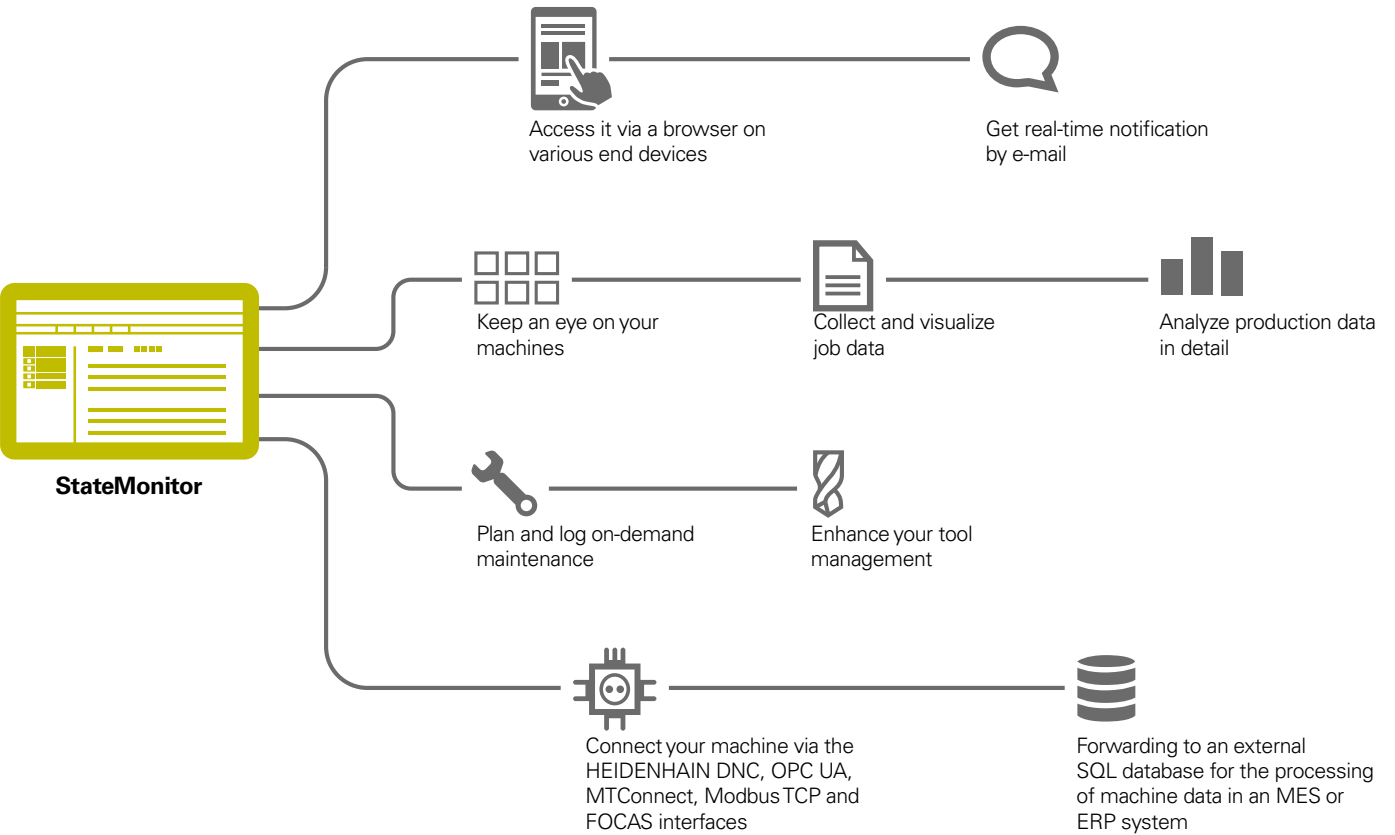

MaintenanceManager displays maintenance and malfunction messages. Maintenance work can be planned based on machining hours, machine messages and intervals of time.

5 Signals collects five additional, machine-specific signals.

5 Machines allows you to connect an additional five machine tools.

TS workpiece touch probes

The **TS workpiece touch probes** from HEIDENHAIN help you perform setup, measuring and inspection functions directly on the machine tool.

The stylus of a TS touch trigger probe is deflected upon contact with a workpiece surface. At that moment the TS generates a trigger signal that, depending on the model, is transmitted either by cable or over an infrared or radio beam to the control.

The control simultaneously saves the actual position values as measured by the machine axis encoders, and uses this information for further processing. The trigger signal is generated by means of a wear-free and highly reliable optical sensor or piezoelectric sensor.

HEIDENHAIN offers probe styli with various ball-tip diameters and stylus lengths.

With a TS touch probe and a KKH calibration sphere from HEIDENHAIN, you can calibrate the rotary axes of your machine and minimize measurement error in the machine's kinematic description. These calibration spheres are also well suited for 3D calibration of the touch probe.

- Benefits of HEIDENHAIN touch probes**
- Idle time reduced through high probing speeds
 - High-quality probing saves repeat measurements
 - Reliable workpiece cleaning removes chips before probing
 - Convenient TNC operation with SE 661 transceiver unit
 - With **TS 460**: collision protection adapter (optional) prevents damage to machine and spindle, and reduces heating of the TS through the spindle
 - With **TS 260**: direct connection with any downstream electronics; no interface required

Touch probe with **radio and infrared transmission** for machines with automatic tool change:

- **TS 460**: universal touch probe
Compact dimensions, energy-saving mode, optional collision protection and thermal decoupling
- **TS 760**: highly accurate touch probe
High probing accuracy and repeatability, low probing force

Touch probe with **cable-bound signal transmission** for machines with manual tool change (e.g., grinding, turning and milling machines):

- **TS 750**: highly accurate touch probe, cable-bound, radial or axial cable connection
- **TS 150/TS 260**: cable-bound touch probe, radial or axial cable connection

TT and TD tool touch probes

Reduce scrap, minimize rework, cut down on idle time and increase machining accuracy: the TT touch probes and TD 110 tool breakage detector from HEIDENHAIN enable efficient and reliable tool inspection and measurement.

Due to their rugged design and high degree of protection, these tool touch probes can be installed directly within the machine tool's work envelope. Tool inspection is possible at any time: before machining, between two machining steps, or after machining is done.

Touch probes
The TT 160 and TT 460 are 3D touch trigger probes for tool measurement and inspection. The disk-shaped probe contact of the TT is deflected during the tactile probing of a tool. In that instant, the TT generates a trigger signal that is transmitted to the control, where it is then processed further. The trigger signal is generated by means of a wear-free and highly reliable optical sensor.

SE transceivers

The following transceivers are available for **wireless signal transmission:**

- **SE 540:** for integration in spindle head; only infrared transmission
- **SE 640:** infrared transmission
- **SE 660:** shared SE for TS and TT; radio and infrared transmission
- **SE 661:** shared SE for TS and TT; radio and infrared transmission, EnDat interface for touch probes

With wireless signal transmission, touch probes are also suited for use on machines with automatic tool change.

The SE 661 transceiver and the TS 460 and TT 460 touch probes are available with the EnDat interface. The EnDat interface from HEIDENHAIN is a digital, bidirectional interface that transmits the trigger status as well as diagnostic information and additional data from the touch probe. Thanks to the interface's serial transmission method, multiple items of data can be transmitted simultaneously.

Digital readouts

HEIDENHAIN digital readouts for manually operated machine tools have universal application: in addition to standard tasks on milling, drilling and boring machines and lathes, they also offer ideal solutions for many applications on machine tools and special machines—in fact all machines where axis slides are moved. This includes radial drilling machines and rapid radial drilling machines.

Digital readouts for manual machine tools increase your productivity. They save time and increase the dimensional accuracy of the finished workpiece while offering very user-friendly operation.

Practice-oriented functions and cycles are available for various applications. The distance-to-go display feature with graphic positioning aid allows you to approach the next nominal position quickly and reliably simply by traversing to a display value of zero. The digital readouts speed up small-batch production—repetitive machining sequences can be saved as a program.

Precise manufacturing made easy: Together with linear encoders from HEIDENHAIN, the digital readouts measure the axis movements directly. The backlash caused by mechanical transfer elements such as lead screws, racks and gears therefore has no influence.

Evaluation units

HEIDENHAIN provides the appropriate evaluation unit for each type of application. They offer numerous functions for measured data acquisition and statistical evaluation of measured values. For automation solutions the results of the measured-data evaluation can be processed further by integrated switching functions. The splash-proof front panel and the sturdy cast-metal housing make evaluation units from HEIDENHAIN impervious to the harshest of everyday shop conditions.

User-friendly environment

Digital readouts and evaluation units with integrated display are specially designed for user friendliness. Typical characteristics:

- Optimally readable, graphic flat panel display
- Intuitive operation using touchscreen or keyboard (depending on the product)
- All-in-one device with compact outside dimensions
- Sturdy aluminum housing
- Reference mark evaluation for distance-coded and single reference marks
- Problem-free installation, maintenance-free operation
- Fast payback with economical use

Evaluation units and digital readouts from HEIDENHAIN feature a data interface for further processing in the higher-level electronics or simply to print out the measured values.

Signal converters

Signal converters from HEIDENHAIN enable the flexible adaptation of interfaces for encoder signals to the requirements of your application. Depending on the application, additional signals (such as temperature-sensor signals) may be processed and transmitted to the downstream electronics.

Digital readouts for manually operated machine tools

Applications for digital readouts are on manually operated machine tools, e.g.:

- Milling machines
- Drilling and boring machines
- Lathes
- Radial drilling machines
- Grinding machines

HEIDENHAIN offers the appropriate digital readout for each of these machine types. The splash-proof front panel and the sturdy aluminum housing make digital readouts from HEIDENHAIN impervious to the harshest of everyday shop conditions.

Evaluation units for metrology applications

Measuring and testing tasks

Evaluation units for measuring and testing tasks are ideal for:

- Measurement equipment
- Adjustment and inspection equipment
- SPC inspection stations
- Multi-gauging fixtures
- Mobile data acquisition
- Positioning equipment

The GAGE-CHEK 2000 evaluation unit is an independently operating device with a built-in screen and robust housing. It features special functions for metrological collection and the statistical evaluation of measurements, such as sorting, minimum/maximum value recording and the storage of measurement series. These data make it possible to calculate mean values and standard deviations, as well as graphically display them in histograms or control charts.

The GAGE-CHEK 4000 SW evaluation software is particularly suitable for positioning tasks on measuring and positioning equipment. You can easily load position values to Excel using a LOG function.

GAGE-CHEK 4000SW is very versatile for multi-gauging fixtures with up to six axes.

Inspection and testing devices

Inspection and testing devices from HEIDENHAIN
HEIDENHAIN encoders provide all of the information needed for setup, monitoring and diagnostics. HEIDENHAIN offers the appropriate PWM inspection devices and PWT testing devices for encoder adjustment and analysis. The PWM inspection devices can be used universally. They have low measuring tolerances and can be calibrated. Testing devices have larger measuring tolerances, fewer available functions, and cannot be calibrated.

HEIDENHAIN encoders can usually be connected either directly or via signal converters to a number of different downstream electronics.

HEIDENHAIN therefore offers encoders and signal converters with various interfaces. The testing and inspection devices from HEIDENHAIN also support various interfaces, which makes their application more flexible (see overview for the PWM 21 and PWT 101).

Signal converters

Signal converters from HEIDENHAIN enable the flexible adaptation of interfaces for encoder signals to the requirements of your application. Depending on the application, additional signals (such as from temperature sensors) may be processed and transmitted to the downstream electronics:

- Adaptation of the interfaces
- Angular measurement with increased accuracy
- Temperature measurement on direct-drive motors
- Computer-aided measured-value acquisition

Incremental signals

~ 1 V_{PP} > □□TTL
~ 11 μA_{PP} > □□TTL

Incremental signals > position values

~ 1 V_{PP} > EnDat
~ 1 V_{PP} > Fanuc Serial Interface
~ 1 V_{PP} > Mitsubishi high speed Interface

Position values

EnDat > DRIVE-CLiQ
EnDat > Fanuc
EnDat > Yaskawa Serial Interface

Adaptation of the interfaces

Signal converters from HEIDENHAIN for the adaptation of the encoder signals to the interface increase compatibility with the downstream electronics. Signals can be interpolated, and various versions (e.g., housing version, connector version or cable version) can be selected for greater flexibility in the application.

IBV 600, IBV 100, IBV 3000, EXE 100 series

In addition to performing signal conversion, the signal converters also interpolate the sinusoidal encoder signals. This permits finer measuring steps, resulting in higher control quality and superior positioning behavior.

- Incremental interface at the input (1 V_{PP} or 11 μA_{PP})
- Incremental interface at the output (TTL)

IBV 6000 series

- Incremental interface at the input (1 V_{PP})
- Multiple outputs (1 V_{PP} or TTL)

Signal converters from HEIDENHAIN are available in various designs:

- Box design
- Plug design
- Cable design
- Version for integration
- Top-hat rail design

Plug design

EIB 100, EIB 3000 series

These signal converters can interpolate the input signals and also feature an integrated counting function. As soon as the reference marks are traversed, an absolute position value is generated and output to the downstream electronics.

- Incremental interface at the input (1 V_{PP})
- Serial interface at the output (EnDat 2.2, Fanuc Serial Interface, Mitsubishi high speed serial interface)

EIB 2391 S, EIB 3392 S, EIB 3392 F, EIB 3391 Y series

These signal converters adapt the encoder information, such as position, temperature or diagnostics, to the format of the output interface.

- Serial interface at the input (EnDat 2.2)
- Serial interface at the output (DRIVE-CLiQ/Fanuc/Yaskawa)

Temperature measurement on direct-drive motors

Monitoring of all three windings for increased cost-effectiveness and protection of the direct-drive motor from overloading: optimized temperature measurement of up to three temperature sensors and compensation of the transmission timing behavior of the temperature measurement for ETEL direct-drive motors.

EIB 5000 series

- Fewer cables required
- Protection of the direct-drive motor from overloading
- Faster response behavior in the event of temperature exceedance
- Increased cost efficiency

Angular measurement with increased accuracy

Position calculation using two scanning heads from rotatory HEIDENHAIN encoders in real time without negative effects on the control loop. Deviations such as eccentric mounting of the graduation of a modular angle encoder or radial runout deviations of the shaft can be compensated for with the EIB 1500.

EIB 1500 series

- Input: Incremental rotatory HEIDENHAIN encoder with two scanning heads and distance-coded reference marks (mounting of the scanning heads relative to each other: 180° ±5°)
- Output: EnDat 2.2, Fanuc Serial Interface or Mitsubishi high speed interface

Computer-aided measured-value acquisition

The signal converters enable the connection of encoders to computer-supported applications that, at the same time, require high resolution of the encoder signals and fast measurement: as an evaluation unit for inspection stations and multi-gauging fixtures.

EIB 700 series

- Signal converters for high-resolution encoder signals and fast measurement
- Connection of multiple evaluation units via Ethernet transmission and, for example, WLAN transmission
- Encoder inputs: 1 V_{PP}, 11 μA_{PP}, EnDat 2.1, EnDat 2.2 or SSI
- Connection of up to four HEIDENHAIN encoders

IK 220 series

- Signal converters for high-resolution encoder signals and fast measurement
- PCI counter card
- Encoder inputs: 1 V_{PP}, EnDat 2.1, EnDat 2.2 or 11 μA_{PP}
- Connection of up to two HEIDENHAIN encoders
